SIEMENS

District heating controller

RVD250

for 1 heating circuit and d.h.w., communicating

Multifunctional heating controller for district heat transfer stations and plants with LPB and M-bus communication. Suited for the control of 1 heating circuit with d.h.w. heating in instantaneous systems or with d.h.w. storage tank. 28 programmed plant types. Operating voltage AC 230 V.

Use

- Types of plants:
 - Autonomous heating group with own d.h.w. heating system, with connection to a district heat transfer station
 - Interconnected plants consisting of several heating groups each with 1 heating circuit and d.h.w. heating system; in a district heat transfer station
- Types of buildings: Residential and nonresidential buildings with own district heat connection and d.h.w. heating system
- Types of heating systems: All types of standard heating systems, such as radiator, convector, underfloor and ceiling heating systems, including radiant panels
- Types of d.h.w. heating systems:
 - D.h.w. heating with storage tank or in instantaneous systems
 - Common or separate heat exchangers for heating circuit and d.h.w. heating
 - D.h.w. heating with electric immersion heater and solar collector

Functions

Heating circuit control	 Weather-compensated flow temperature control, mixing valve with 3-position actuator 					
	• Weather-compensated flow temperature control with room influence, mixing valve with 3-position actuator					
	Room-compensated flow temperature control, mixing valve with 3-position actuator					
	 Demand-dependent control of the common flow temperature 					
Precontrol	Demand-dependent precontrol of heating circuit flow in interconnected plants					
D.h.w. control	 D.h.w. heating with coil type storage tanks, with or without mixing valve in the secondary circuit 					
	 D.h.w. heating with stratification storage tanks 					
	 Direct d.h.w. heating off heat exchanger 					
	D.h.w. heating with electric immersion heater and solar collector					
Other functions	Optimized heating up and setback					
	 Automatic heating limit (automatic ECO function) 					
	 Frost protection (for the building, plant, and d.h.w.) 					
	 365-day clock with automatic summer- / wintertime changeover 					
	 Independent time programs for heating circuit and d.h.w. heating 					
	Adjustable heating period					
	 Maximum limitation of flow temperature rise and flow alarm 					
	 Analog (DC 010 V) and digital input 					
	 PWM output for speed-controlled pump 					
	 Communication via LPB (Local Process Bus) and M-bus 					
	Pump and valve kick					
	 Cooling down protection in the case of direct d.h.w. heating off parallel heat exchanger 					
	 Flow switch with adjustable load limit, seasonal adaptation and child-proofing 					
	 Differential temperature limitation for heat exchanger (DRT function) 					
	 Minimum limitation of flow rate for suppression of hydraulic creep 					
	 Relay and sensor test 					
	Remote control with room unit					
	Refill function					
Type summary						

Description	Instructions in	Product no.	Stock number
District heating and	German, French, English, Italian,	RVD250-A	S55370-C125
d.h.w. controller	Danish, Finnish, Swedish		
District heating and	Polish, Czech, Greek, Russian,	RVD250-C	S55370-C126
d.h.w. controller	Bulgarian, Romanian		

Ordering

When ordering, please give product no. **RVD250** and language code **-A** or **-C** for the Operating and Installation Instructions in the required languages.

Sensors, room units, actuators and valves must be ordered as separate items.

Examples: **RVD250-A** for German, French, etc. **RVD250-C** for Polish, Czech, etc.

Note

Suitable sensors and room units	 Flow, return and d.h.w. temperature: All sensors with sensing element LG-Ni1000, e.g.: Strap-on sensor QAD22 Immersion sensors QAE212 and QAP21.3 Collector sensor QAP21.2 (solar) Room temperature: Room units (PPS) QAW50 and QAW70 Room sensor (PPS) QAA10 Outside temperature: Outside sensor QAC22 (sensing element LG-Ni1000) Outside sensor QAC32 (sensing element NTC 575) Pressure: Sensors delivering DC 010 V signals, e.g. Pressure sensor QBE2002
Note	The RVD250 controller automatically identifies the type of sensor used.
Suitable actuators	All types of Siemens electromotoric and electrohydraulic actuators for 3-position control operating on AC 24230 V can be used. With d.h.w. applications, consideration must be given to actuator running times and sensor time constants. For detailed information, refer to the Basic Documentation. For detailed information about actuators and valves, refer to the respective Data Sheets.

Technical design

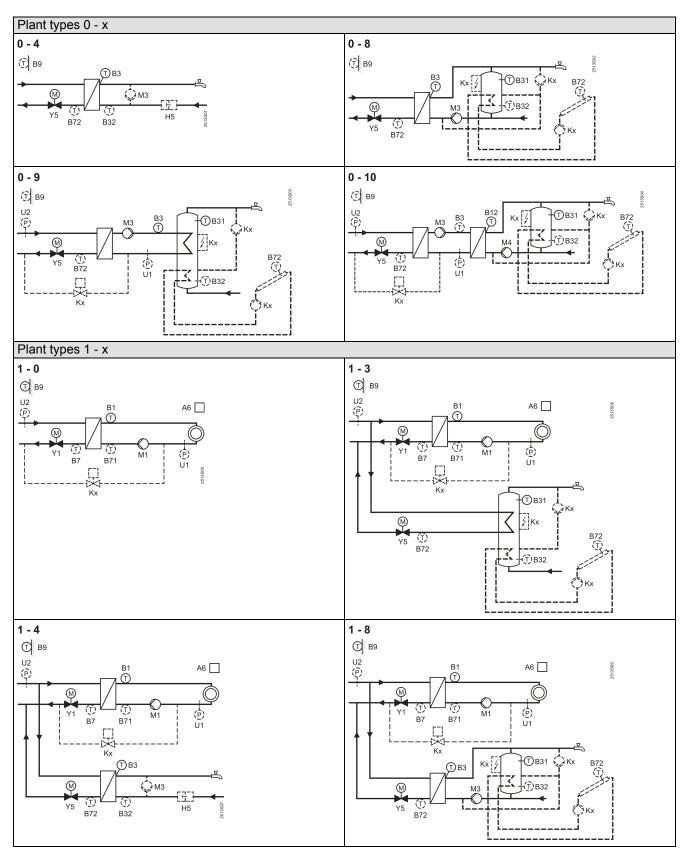

Functioning

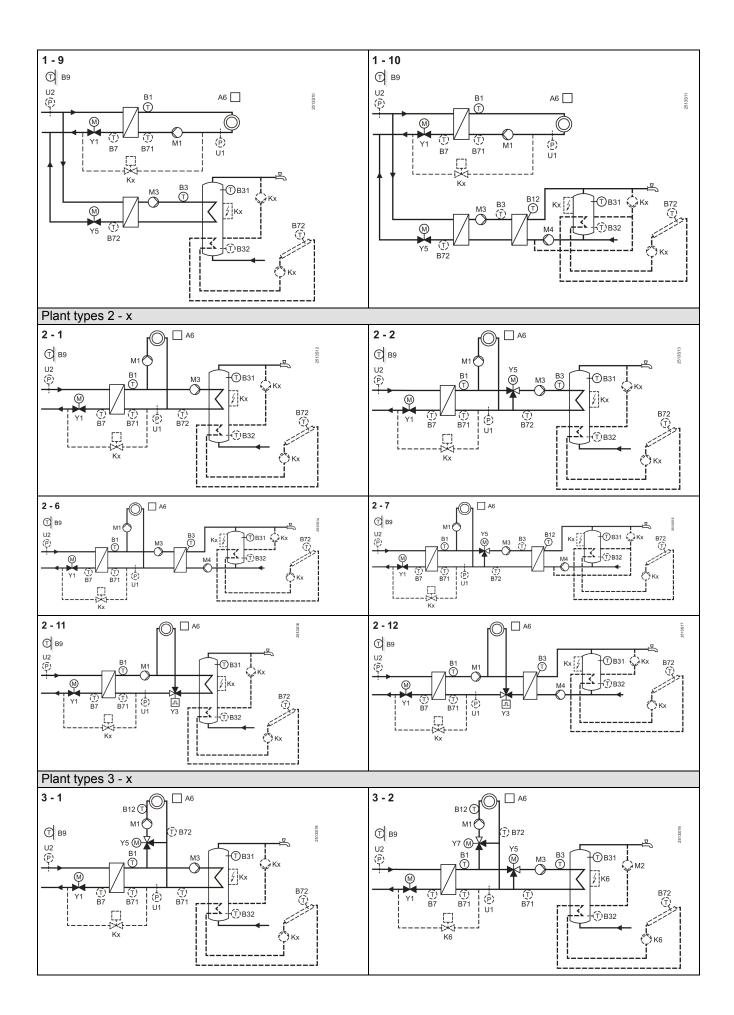

The RVD250 controller allows the configuration of 28 different plant types as combinations of heating circuit and d.h.w. heating system. When commissioning a plant, the relevant plant type must be selected and entered. All required functions, settings and displays are then automatically assigned, and parameters that are not required will be hidden.

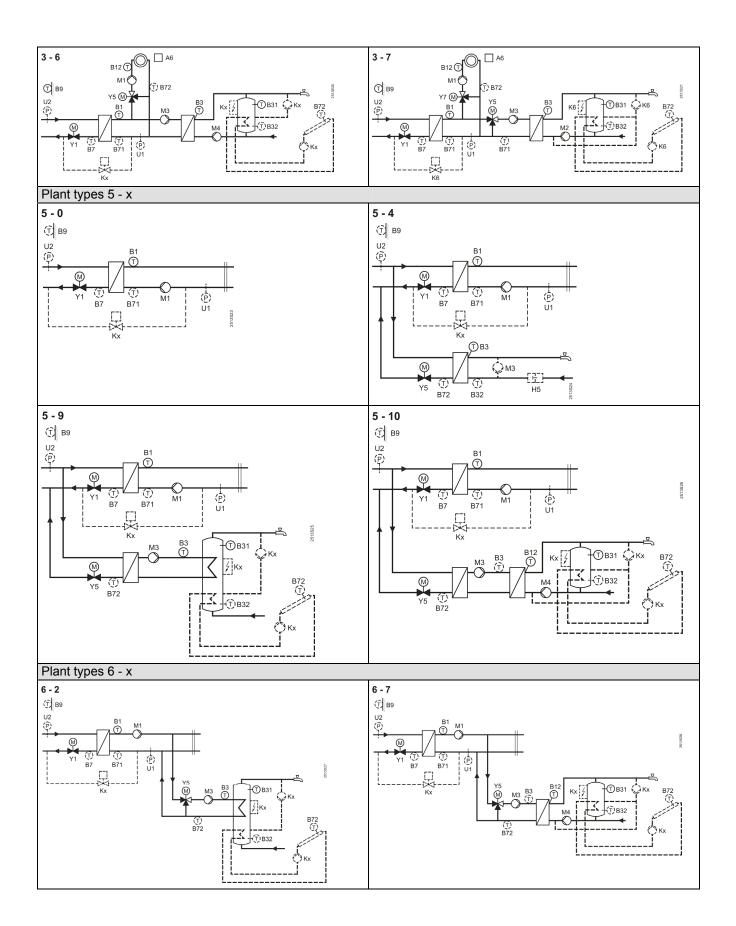

Note

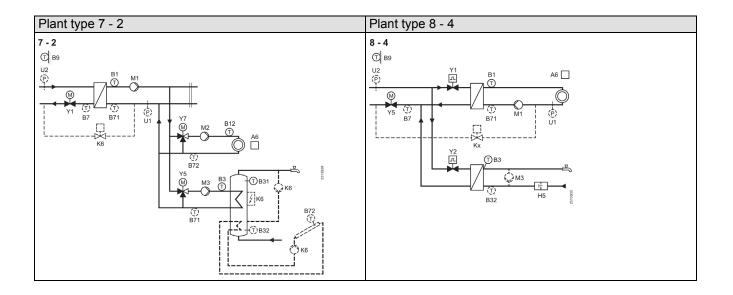

Optional functions are to be configured in addition to the standard functions.

Plant types

Operating modes	 Auto Automatic operation Automatic heating according to the time program; automatic ECO function and room unit active. Continuous operation Heating without time program, setpoint according to the setting knob. Protection Heating off, frost protection ensured. Automatic d.h.w. heating Manual control No control, pumps in operation.
Notes	 Frost protection is ensured in all operating modes The operating mode of the heating circuit has no impact on d.h.w. heating
Heating circuit control	 The RVD250 controller provides control of the following types of heating circuits: Pump heating circuit off heat exchanger Mixing heating circuit off heat exchanger Common flow off heat exchanger Common flow off heat exchanger and separate mixing heating circuit
Compensating variables	With weather-compensated control, the composite outside temperature is used as the compensating variable. It is calculated (by the controller) from the current and the attenuated outside temperature. The building time constant is adjustable.
Setpoints	Adjustable are the setpoints for the nominal room temperature, the reduced room temperature, and the room temperature for frost protection.
Generation of the flow temperature setpoint	 The assigned flow temperature setpoint is generated as follows: For weather-compensated control: The setpoint is continuously determined by the outside temperature. The assignment of the flow temperature to the outside temperature is made by the heating curve For weather-compensated control with room influence: The setoint is determined by the outside temperature and, in addition, by the deviation of room temperature setpoint and actual value For room-compensated control: The setpoint is determined by the room temperature deviation of setpoint and actual value

A maximum limitation can be set for limiting the rate the flow temperature setpoint increases. Also, a flow alarm is used; the period of time the flow temperature is allowed to remain outside a defined setpoint range can be set. When this period of time has elapsed, an error message is delivered.

The control variable for the heating circuit is the secondary flow temperature. With all Heating circuit control plant types, control is provided via the 2-port valve in the primary return, depending on the plant's total demand for heat (heating circuit and d.h.w. circuit).

Heating outro					
Heating curve	s = 4.0 3.5 3.25 3.0 2.75 2.5 2.25				
	100 2.0				
	90 1.75				
	80 1.5				
	70 1.25				
	60 1.0				
	50 0.75				
	40 0.5				
	30 0.25				
	20				
	20 15 10 5 0 -5 -10 -15 -20 -25 -30 -35 T _{AM}				
	s Heating curve slope T _{AM} Composite outside temperature Tv Flow temperature				
Maximum limitation of the	• Primary circuit: The valve in the primary circuit is driven toward the FULLY CLOSED				
return temperature	position when the limit value is exceeded. The characteristic runs constant-shifting-				
	constant, depending on the outside temperature				
	• Secondary circuit: The valve in the secondary circuit is driven toward the FULLY				
	CLOSED position when the limit value is exceeded. The difference to the primary circuit's limit value must be set				
Optimization	Control is optimized; switching on and heating up as well as switching off are controlled such that during occupancy periods the required room temperature is always				
	maintained.				
	At the end of each occupancy period, the heating is switched off (circulating pump) until				
	the room temperature setpoint for nonoccupancy periods is reached (quick setback,				
	can be deactivated).				
	Maximum limit values for the heating up time and for early shutdown can be set. The optimization functions can be deactivated.				
Automatic ECO function	The automatic ECO function controls the heating system depending on demand; it is				
	deactivated if permitted by the progression of the outside temperature. For that,				
	consideration is given to the current, the attenuated and the composite outside				
temperature, as well as an adjustable heating limit. The automatic ECO function requires an outside sensor. The function can be					
	deactivated, if required.				
Maximum and minimum	Both limitations are effected via the heating curve; at the limit value, the heating curve				
limitation of the flow	changes to a constant value. Active limitations are shown on the display. Both limitations can be deactivated.				
temperature					
DRT function	For the differential of primary and secondary return temperature, a maximum limitation				
	can be set.				

Pump and valve kick	A kick can be activated for all pumps and valves, aimed at preventing them from seizing. The kick lasts 30 seconds and is made once a week.
Relay and sensor test	 To facilitate commissioning and fault tracing, the controller can perform the tests: Relay test: Each relay can be manually energized Sensor test: The current sensor values can be queried Setpoint test: The current setpoints can be queried
Increasing the reduced room temperature	The setpoint of the reduced room temperature can be increased as the outside temperature drops. The rate of increase is adjustable. This function can be deactivated.
Frost protection for the building	Frost protection for the building ensures that an adjustable minimum room temperature is maintained. This function cannot be deactivated.
Frost protection for the plant	 Frost protection for the plant protects the heating system against freeze-ups by activating the heating circuit pump. It can be provided with or without outside sensor: With outside sensor: Outside temp. ≤ 1.5 °C: Heating circuit pump runs for 10 minutes at 6-hour intervals Outside temp. ≤ -5 °C: Heating circuit pump runs continuously Without outside sensor: Flow temp. ≤ 10 °C: Heating circuit pump runs for 10 minutes at 6-hour intervals Flow temp. ≤ 5 °C: Heating circuit pump runs for 10 minutes at 6-hour intervals Flow temp. ≤ 5 °C: Heating circuit pump runs continuously.
Signal inputs	 Analog input for displaying and forwarding DC 010 V signals, or for heat demand DC 010 V Digital input for pulses or signals from a flow switch or heat meter, for heat demand or alarms
Suppression of hydraulic creep	Minimum limitation of the flow rate aimed at suppressing hydraulic creep can act on both the heating circuit and the common primary return. The limitation is ensured by an auxiliary switch in the actuator.
Refill function	The RVD250 controller supports the refill function, aimed at maintaining the plant pressure on the secondary side. If the pressure drops below a minimum value, water is fed from the primary side or a separate tank to the plant's circuit on the secondary side to ensure the pressure will increase again.
Heating period	Outside the adjustable heating period, the heating circuit is switched off. The display shows ECO. Switching off takes place in addition to the automatic ECO function and summer- / wintertime changeover. Frost protection for the building and the plant is maintained. This function has no impact on d.h.w. heating.
Precontrol	Precontrol is accomplished via the valve in the heat exchanger's primary return, depending on demand. The heat demand signal is delivered via the LPB data bus.

D.h.w. heating	 The RVD250 controller provides d.h.w. control with the following plant types and d.h.w. heating systems: Stratification storage tank with charging pump (or diverting valve) and 2 sensors, with or without mixing valve in the d.h.w circuit (or intermediate circuit) Coil type storage tank with intermediate circuit pump and 2 sensors, with or without mixing valve in the d.h.w. circuit Directly off system's own heat exchanger The heat for the d.h.w. circuit can be supplied either by the system's own heat exchanger or the common flow (heating circuits and d.h.w. circuit).
Settings	The nominal and the reduced setpoint, maximum setpoint, setpoint increase, switching differential, overrun time of charging pump, and the maximum duration of d.h.w. charging are adjustable.
Frost protection for d.h.w.	A minimum d.h.w. temperature of 5 °C is always ensured.
Manual charging	Independent of time program and temperature conditionsDuring protection of heating circuit
Limitation	The maximum limitation of the primary return temperature can be adjusted. The adjusted limit value is independent of heating circuit control.
Releases	 The release of d.h.w. charging and the circulating pump can be selected: Always (24 hours a day) According to own d.h.w. time program During the controller's heating circuit time program (d.h.w. charging with forward shift of first daily release)
Priority	 The behavior of the heating circuit during d.h.w. charging can be selected: Absolute: Heating circuit pump OFF, or heating circuit mixing valve FULLY CLOSED and pump ON Shifting: Heating circuit pump remains ON as long as heat is available. Control to the d.h.w. temperature setpoint or the maximum setpoint Parallel: No priority; heating circuit remains ON. Control to the d.h.w. temperature setpoint or the maximum setpoint
Cooling down protection	In the case of instantaneous systems, the heat exchanger's primary side is heated up at certain intervals.
Flow switch	To improve the heat exchanger's control performance, with adjustable load limit and for seasonal adaptation and as child-proofing (flow switch prevents control from responding too frequently).
Forced charging	D.h.w. charging takes place daily, always at the time of the first release (or at midnight with the 24-hour program). It is performed also when the actual value lies within the switching differential.
Legionella function	The d.h.w. is heated up at certain intervals to ensure protection against legionella viruses.
Electric immersion heater and solar collector	In the case of plant types with d.h.w. storage tank, the 2 multifunctional relays for d.h.w. heating with electric immersion heater and solar collector can be parameterized.
Note	Availability of the above mentioned functions depends on the type of d.h.w. heating.

Miscellaneous functions

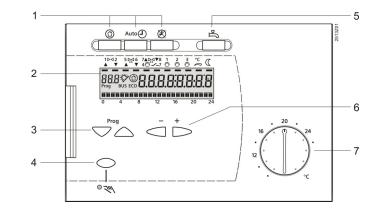

Time switch programs	For automatic operation, the RVD250 controller has a 7-day program with 3 adjustable heating periods per day. Another 7-day program is available for the release of d.h.w. charging. Using the 365-day clock with automatic summer- / wintertime changeover, a maximum of 8 holiday periods can be programmed. During holiday periods:
	Heating circuit control is in protection mode and the d.h.w. will not be heated
Remote control with room unit	 Room unit QAW50: Changeover of operating mode, setting the room temperature setpoint, and room temperature readjustment
	 Room unit QAW70: Overriding setpoints, the heating program and the holiday program
PWM output	A PWM (pulse width modulation) output is available for the connection of a speed- controlled pump.
Pulse lock for actuators	To reduce wear and tear on the relay contacts, the total duration of the OPEN / CLOSE pulses delivered to an actuator is limited to 5 times its running time.
Communication	 Via LPB, e.g. assignment of d.h.w., master-slave assignments for the time switch, reception of outside temperature signal, reception of heat demand (when RVD250 is used as a primary controller) Via M-bus
Manual control	 In the case of manual control, the heating can be controlled manually; d.h.w. heating remains activated. The relays are energized / deenergized as follows: Actuator driving the primary return valve: Dead, but can be controlled manually from the controller Other actuators fully closed, dead Heating circuit pump activated Collector pump activated and electric immersion heater released

Mechanical design

Controller

The RVD250 consists of controller insert and base. The controller insert accommodates the electronics, the power section and 10 relays. The front carries the operating elements and the backlit display. The controller insert is secured to the base with 2 screws. The base accommodates the connection terminals.

Display and operating elements

Buttons for selecting the operating mode 1

2

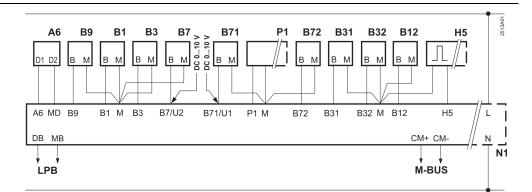

- Display (LCD) Buttons for selecting the operating lines Button for manual control ON / OFF Button for d.h.w. heating ON / OFF 3
- 4
- 5
- Buttons for adjusting values 6
- Setting knob for nominal room temperature setpoint 7

Operation	 Operating elements: Setting knob for the nominal room temperature setpoint Button for the respective operating mode Button for manual control Button for d.h.w. heating The setting and readjustment of all other parameters, the activation of functions and reading actual values and statuses follow the operating line principle. An operating line with a number is assigned to each parameter, each actual value and each function. For selection of the operating lines and the adjustment of values, 2 pairs of buttons (3) and (6) are available. The enclosed Operating Instructions can be inserted in the rear of the cover.
Notes	
Engineering Electrical installation	 The cables of the measuring circuits carry extra low-voltage The cables to the actuator and pumps carry AC 24230 V Local regulations for electrical installations must be complied with Sensor cables must not be run parallel to mains carrying cables powering actuators, pumps, etc. (safety class II conforming to EN 60730)
Radiator valves	In control systems using a room temperature sensor, the reference room must not be equipped with thermostatic radiator valves; manual valves must be locked in their fully open position.
Refill function	When making use of the refill function, the local regulations and those of the district heat utility must be observed.
Lightning protection	 If bus cables are also laid outside buildings, the devices are exposed to transients of lightning strokes and must be appropriately protected Every bus cable and the devices to be protected demand matching protective equipment Protection is ensured only if the installation is in proper working order For notes on installation in compliance with EMC requirements, refer to Data Sheet CE1N2034
Installation Types of mounting	 Wall mounting (on a wall, in a control panel, etc.) Standard mounting rail (top hat rail) Flush mounting (cutout in control panel door, etc.)
Mounting location	Suitable mounting locations are control panels, control desks, compact stations, or the heating room. Not permitted are damp or wet spaces.
Connections	All connection terminals for protective extra low-voltage (sensors and room unit bus) are located on the upper terminal block, those for mains voltage (actuators and pumps) on the lower terminal block.
Commissioning	 Selection of plant type The settings can be completely or partly disabled on the software side. In addition, the district heat parameters can be disabled on the hardware side The controller is supplied complete with Installation, Mounting and Commissioning Instructions

	In terms of disposal regulations, the RVD250 is classified as electronic scrap conforming to the European Directive 2002/96/EG (WEEE) and must not be disposed of as domestic waste. The relevant national regulations must be observed and the controller must be disposed of through the appropriate channels. Local and currently valid legislation must be observed.			
Warranty				
	When using the RVD250 in connection with third-party devices, correct functioning must be ensured by the user. In that case, Siemens will assume no responsibility for service and warranty.
